### 9.0 Introduction

Lesson Eight considered only first declension feminine nouns. All of these nouns terminated with either *alpha* or  $\bar{e}ta$  in their nominal stem. They were subdivided into three distinct paradigms and designated as n-1a, n-1b, and n-1c. The differences between these paradigms were due to phonetic changes in the singular inflected forms (plural forms are identically inflected) because of the next to the last letter of the noun's stem.

In review, if the next to the last letter of the feminine stem is a vowel or  $rh\bar{o}$ , the nominative singular vocalic stem *alpha* is retained throughout the singular forms and considered as the *alpha* pure pattern (n-1a). With a few exceptions, the final *alpha* is also long.

Another significant classification of first declension feminine nouns was the  $\bar{e}ta$  pure nouns. These nouns differed from n-1a nouns in that all singular forms terminated with  $\bar{e}ta$  instead of *alpha*. Feminine nouns belonging to this paradigm were designated n-1b.

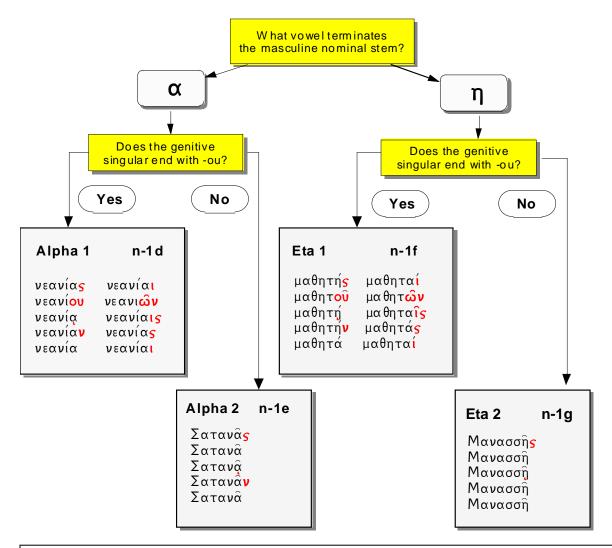

The final paradigm discussed in the last lesson was the feminine nouns that exhibit a mixture of n-1a and n-1b singular case endings, or the "hybrid-pattern". The vocalic stem vowel *alpha* of the nominative singular lengthens to  $-\eta_S$  and  $-\eta$  in the genitive and dative singular respectively. Phonologically, this hybrid pattern occurs when a sibilant phoneme (*zēta*, *sigma* or a compound consonant) precedes the vocalic stem vowel *alpha*. Nouns belonging to this paradigm are designated as n-1c.

Including proper names, NTGreek also contains one hundred and eightyfour masculine nouns that belong to the first declension. As to be expected, masculine nouns of this declension display different singular case endings than those of feminine nouns of the same declension. These differences and their paradigms, designated as n-1d, n-1e, n-1f, n-1g, and n-1h, are the primary focus of this lesson.

#### 9.1 Observations of First Declension Masculine Nouns

- 1. All nouns belonging to the first declension, whether feminine or masculine, exhibit the vowel *alpha* or *ēta* at the end or near the end of their nominative singular form.
- 2. Masculine nouns make up only about thirty percent of all first declension nouns. There are not any neuter nouns in the first declension.
- 3. The nominative singular is the lexical entry for all first declension masculine nouns.
- 4. All first declension nouns whose nominative singular ends in  $-\alpha_S$  or  $-\eta_S$  are masculine.
- 5. Masculine nouns of the first declension are divided into five separate paradigms, designated as n-1d, n-1e, n-1f, n-1g, and n-1h.
- 6. Regardless of the manner in which first declension masculine nouns are formed, they all exhibit identical plural case endings (exactly like those of first declension feminine nouns). The article inflects to modify the masculine noun according to gender, number, and case.
- 7. The vocative singular is NOT identical to the nominative singular case forms; however, the plurals are.

The flow chart illustrates the simplicity of determining the paradigm that a first declension masculine noun will follow. These four paradigms (n-1d, n-1e, n-1f, n-1g) represent 100% of all uncontracted first declension masculine nouns. Contracted first declension masculine nouns (n-1h; only two in NTGreek) always decline like paradigm n-1f nouns (cf. §9.7.2).

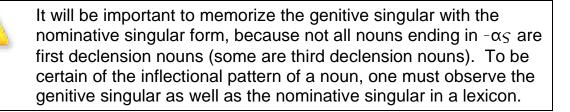

Two decisions are always necessary in determining the correct paradigm for a masculine noun.

- Which vowel (alpha or ēta) terminates the nominal stem?
- Does the genitive singular terminate with -ou?

Regardless which paradigm first declension masculine nouns follow, their plural case endings are always the same (both masculine and feminine plural case endings are identical). Furthermore, first declension masculine nouns in paradigms n-1e and n-1g occur only in the singular.

#### 9.3 First Declension *Alpha* 1 Masculine Nouns (n-1d)

Nominal stems ending with *alpha* and the abbreviated genitive singular -ou are first declension masculine nouns. The declension-paradigm notation for this classification of nouns is n-1d. All but three nouns are proper nouns, which are declined in the singular only. The only n-1d plural forms in NTGreek are  $\mu\eta\tau\rhoo\lambda\dot{\omega}\alpha_{1S}$  and  $\pi\alpha\tau\rhoo\lambda\dot{\omega}\alpha_{1S}$ .

**9.3.1 Case formation.** First declension masculine nouns terminating with *alpha* and the abbreviated genitive singular -ou, have the following inflected case endings. Notes concerning case formation follow.

n-1d	Singular Case Endings	Plural Case Endings
Nominative	<b>S</b> <sup>1, 2</sup> (identical to accusative plural)	<b>l</b> (identical to vocative plural)
Genitive	OU <sup>3</sup> (contraction)	(contraction)
Dative	l (subscript) <sup>4</sup> (contraction)	١٢
Accusative	ν	<b>S</b> <sup>2</sup> (identical to nominative singular)
Vocative	<sup>5</sup> (no case ending)	<b>l</b> (identical to nominative plural)

- 1. N-1d masculine noun stems are identified by removing the nominative singular case ending (*sigma*). The nominative singular is the lexical form for all n-1d nouns.
- 2. The case ending *sigma* is the case ending for both the nominative singular and the accusative plural (and not the genitive singular and accusative plural as in n-1a, n-1b, and n-1c first declension feminine

nouns). Context will help to determine the proper function of the noun.

- 3. First declension n-1d masculine nouns do not use the *sigma* for the genitive singular as do the feminine nouns in order to avoid confusion with the inflected nominative singular. These nouns borrow the second declension case ending -ou.
- 4. The masculine dative singular is actually the stem + 1. The *iota* regularly monophthongizes and is written under the long *alpha* as an *iota* subscript.

Dative Singular:  $v \in \alpha v \mid \alpha + 1 > v \in \alpha v \mid \alpha \mid > v \in \alpha v \mid \alpha \mid$ 

The stem vowel, *alpha*, first combines with the dative masculine singular case ending, *iota*, to create a diphthong.

The diphthong becomes a single vowel sound by the formation of the improper diphthong,  $\alpha$ .

- 5. The vocative singular retains the long "pure" nominal stem whereas the nominative singular has the case ending *sigma*.
- 6. The genitive plural is  $-\hat{\omega}v$  because of vowel contraction. The circumflex accent is evidence of this contraction.
- **9.3.2 Paradigm.** A representative n-1d paradigm follows.

νεανίας, -ου, ό (youth, young man) νεανια + case ending Listen

	n-1d	Singular		Plural

**9.3.3 Vocabulary paradigms.** For illustration, examples from the vocabulary words of this lesson whose noun stems terminate in *alpha* and have the genitive singular -ou are declined below.

All declined words below are proper nouns except for one. Plural forms should not be expected for proper names. All proper nouns begin with a capital letter to follow modern convention. The final vocalic stem vowel *alpha* is always long. Furthermore, because the nominative and vocative singulars are declined differently, the vocative is included in these examples.

**9.3.31 Proper names.** As reference, the remaining proper names are declined as the nouns above. None of these proper names appear in the plural in NTGreek. The lesson's vocabulary will not contain these as most of them transliterate well into English.

#### 9.4 First Declension Alpha 2 Masculine Nouns (n-1e)

Nominal stems ending with *alpha* and the abbreviated genitive singular  $-\alpha$  are first declension masculine nouns. All but four nouns belonging to this declension-paradigm are proper nouns, with no plural forms occurring in NTGreek, whether for proper or common nouns. The declension-paradigm notation for this classification of nouns is n-1e.

N-1e differs from n-1d first declension masculine nouns only in that the genitive singular retains the long vocalic "pure" nominal stem like the vocative rather than the borrowed second declension ending  $-\infty$ . There is absolutely no way to determine whether a first declension masculine noun ending with  $-\alpha_S$  in the nominative singular will have  $-\infty$  or  $-\alpha$  in the genitive singular other than by consulting a lexicon.

**9.4.1 Case formation.** First declension masculine nouns terminating with *alpha* with the genitive singular  $-\alpha$ , have the following case endings. Notes concerning case formation follow.

n-1e	Singular Case Endings	Plural Case Endings
Nominative	<b>S</b> <sup>1,2</sup>	
Genitive	3	
	(no case ending)	
Dative	l (subscript) <sup>4</sup> (contraction)	
Accusative	ν	
Vocative	5	
vocative	(no case ending)	

- 1. N-1e masculine noun stems are identified by removing the nominative singular case ending (*sigma*). The nominative singular is the lexical form for all n-1e nouns.
- 2. Because there are not any n-1e nouns that occur in the plural, possible confusion between the singular nominative case ending with *sigma* and the accusative plural is non-existent.

- First declension n-1e masculine nouns do not use the *sigma* for the genitive singular as do the feminine nouns in order to avoid confusion with the inflected nominative singular. The genitive singular retains the long vocalic "pure" nominal stem (like the vocative) rather than borrowing the second declension ending -ou. There is absolutely no way to determine whether a first declension masculine noun ending with -α<sub>S</sub> in the nominative singular will have -ou or -α in the genitive singular other than by consulting a lexicon.
- 4. The masculine dative singular is actually the stem + 1. The *iota* regularly monophthongizes and is written under the long *alpha* as an *iota* subscript.
- 5. The vocative singular retains the long "pure" nominal stem (like the genitive singular), whereas the nominative singular has the case ending *sigma*.
- 9.4.2 Paradigm. A representative n-1e paradigm follows.

**9.4.3 Vocabulary paradigms.** Examples from the vocabulary words of this lesson whose noun stems terminate with *alpha* and have the genitive singular  $-\alpha$  are declined below. All declined words are proper nouns. Plural forms should not be expected for proper names. The final *alpha* of the nominal stem is always long in n-1e nouns.

#### 9.5 First Declension *Ēta* 1 Masculine Nouns (n-1f)

Nominal stems ending with  $\bar{e}ta$  and the abbreviated genitive singular -ou are first declension masculine nouns and are designated as n-1f. A consonant ALWAYS precedes the vocalic terminal stem. This category of nouns comprises the largest proportion of first declension masculine nominal stems.

N-1f differs from n-1d first declension masculine nouns in two respects: the substitution of the terminating  $\bar{e}ta$  for *alpha* in the vocalic stem (the genitive singular for both paradigms is -ou), and the use of a short *alpha* in the vocative singular if the terminal consonant is *tau*, otherwise, the vocative singular retains the stem's vocalic pure  $\bar{e}ta$ .

**9.5.1 Case formation.** First declension masculine nouns that terminate in  $\bar{e}ta$  and have a genitive case -ou exhibit the following case endings. Notes concerning case formation follow.

n-1f	Singular Case Endings	Plural Case Endings
Nominative S <sup>1, 2</sup> (identical to accusative plural)		<b>ا</b> (identical to vocative plural)
Genitive	OU <sup>3</sup> (contraction)	(contraction)
Dative	l (subscript) <sup>4</sup> (contraction)	١٢
Accusative	ν	<pre>     S<sup>2</sup> (identical to nominative singular) </pre>
Vocative	<mark>(α/</mark> η) ⁵	<b>l</b> (identical to nominative plural)

- 1. N-1f masculine noun stems are identified by removing the nominative singular case ending (*sigma*). The nominative singular is the lexical form for all n-1f nouns.
- 2. The case ending *sigma* is the case ending for both the nominative singular and the accusative plural (and not the genitive singular and accusative plural as in n-1a, n-1b, and n-1c first declension feminine nouns). Context will help to determine the proper function of the noun.
- 3. First declension n-1f masculine nouns do not use the *sigma* for the genitive singular as do the feminine nouns in order to avoid confusion with the inflected nominative singular. These nouns borrow the second declension case ending -ou.
- 4. The masculine dative singular is actually the stem + 1. The *iota* regularly monophthongizes and is written under the *ēta* as an *iota* subscript.
- 5. The vocative singular for n-1f nouns may be either a short *alpha* or the retention of the *ēta* "pure" nominal stem. If the consonant which

occurs before the vocalic stem is *tau*, the vocative case ending is always a short *alpha*, otherwise *ēta*.

- 6. The genitive plural is  $-\hat{\omega}v$  because of vowel contraction. The circumflex accent is evidence of this contraction.
- 9.5.2 Paradigm. A representative n-1f paradigm follows.

#### 9.6 First Declension *Ēta* 2 Masculine Nouns (n-1g)

Nominal stems terminating with the vocalic stem  $\bar{e}ta$  and the abbreviated genitive singular  $-\eta$  are first declension masculine nouns and are designated as n-1g. The only examples of this paradigm in NTGreek are  $M\alpha\nu\alpha\sigma\sigma\eta_S$  and  $I\omega\sigma\eta_S$ . The later proper noun only occurs in Matthew 13:55 and 27:56 as a variant reading. No plural forms are attested.

N-1g nouns are distinctive in that the accented vocalic *ēta* pure stem is used throughout the singular except for the nominative singular.

**9.6.1 Case formation.** First declension masculine nouns terminating with  $\bar{e}ta$  and a genitive of  $-\eta$  have the following case endings. Notes concerning case formation follow.

<u>n-1g</u>	Singular Case Endings	Plural Case Endings
Nominative	<b>S</b> <sup>1,2</sup>	
Genitive	(no case ending)	
Dative	l (subscript) <sup>4</sup> (contraction)	
Accusative	(no case ending)	
Vocative	<sup>3</sup> (no case ending)	

- 1. N-1g masculine noun stems are identified by removing the nominative singular case ending (*sigma*). The nominative singular is the lexical form for all n-1g nouns.
- 2. There are no attested plurals for these nouns in NTGreek. However, if there were, the nominative singular and the accusative plural would share inflected case endings.
- 3. The genitive, accusative, and vocative singulars share inflected case endings, the vocalic stem *ēta*.
- 4. The masculine dative singular is actually the stem + 1. The *iota* regularly monophthongizes and is written under the *ēta* as an *iota* subscript.
- 5. The normal accusative singular case ending -v is truncated, leaving only the accented vocalic stem vowel  $\bar{e}ta$ .
- **9.6.2 Paradigm.** A representative n-1g paradigm follows.

#### 9.7 First Declension Contract Nouns (n-1h)

Six first declension nouns in NTGreek are contracted. Two of them are masculine proper names and the others common nouns. Of these common nouns, only one is masculine and the others feminine. Because these nouns share other paradigm patterns already studied, there are not any new case endings to be learned with this paradigm.

These six nouns originally ended with two vowels that contracted, resulting in further contraction with the vowel case ending (if any). Because these nouns underwent contraction, the final vowel is long and will always have a circumflex over the stem vowel.

The declension-paradigm notation for all first declension contract nouns is n-1h, whether feminine or masculine.

#### 9.7.1 Feminine contract nouns.

**9.7.11 Contracted alpha alpha.**  $M\nu\hat{\alpha}$  ("mina") is the only first declension feminine n-1h contracted noun in NTGreek (5x) that originally ended with  $-\alpha\alpha$ . The noun is declined identically to n-1a nouns.

The non-contracted form,  $\mu\nu\alpha\alpha$ , is never found in NTGreek. The lexical entry form is its contracted form,  $\mu\nu\hat{\alpha}$ .

**9.7.12 Contracted** *epsīlon-alpha*.  $\Gamma \hat{\eta}$  ("earth, soil"; +250x) and  $\sigma \nu \kappa \hat{\eta}$  ("fig tree"; 16x) are the only two contracted feminine nouns in NTGreek that originally ended with  $-\epsilon \alpha$ . These nouns are declined identically to n-1b nouns. Furthermore, neither of these nouns occurs in the plural.

The non-contracted forms,  $\gamma \epsilon \alpha$  and  $\sigma \nu \kappa \epsilon \alpha$ , are never found in NTGreek. The lexical entry forms are their contracted form,  $\gamma \hat{\eta}$  and  $\sigma \nu \kappa \hat{\eta}$ .

#### 9.7.2 Masculine contract nouns

**9.7.21** `Epµ $\hat{\eta}_S$  ("Hermes") and 'A $\pi\epsilon\lambda\lambda\hat{\eta}_S$  ("Apelles") are the only two n-1h contracted masculine proper names in NTGreek that originally ended with  $-\epsilon\alpha$ . These nouns are declined identically to n-1f nouns.

The non-contracted forms,  $E_{\rho\mu\epsilon\alpha}$  and  $A_{\pi\epsilon\lambda\lambda\epsilon\alpha}$ , are never found in NTGreek. The lexical entry forms are their contracted forms.

**9.7.22**  $\beta \circ p \rho \hat{\alpha}_S$ ,  $-\hat{\alpha}$ ,  $\hat{\circ}$  ("north") is the only contracted n-1h masculine <u>common noun</u> in NTGreek (2x) that ended with  $-\epsilon \alpha$ . It only occurs in the genitive case as part of a prepositional phrase and follows the n-1e declension pattern.

#### 9.8 Declension-Paradigm Notation for First Declension Masculine and Contract Nouns

The five paradigms encountered in this lesson for first declension masculine and contract masculine and feminine nouns are presented in tandem for the purposes of comparing and contrasting the singular inflected forms. Except for accent, all plurals are inflected identically.

## n-1e (Alpha 2)

The abbreviation n-1e represents the following:

- n = noun (part of speech)
- 1 = first declension
- e = paradigm "e"

All n-1e nouns occur only in the singular in NTGreek. Except for three nouns, all are proper nouns.

# n-1f (*Ēta* 1)

The abbreviation n-1f represents the following:

- n = noun (part of speech)
- 1 = first declension
- f = paradigm "f"

Most first declension masculine nouns in NTGreek follow this paradigm.

	n-1g	(Ēta 2)	n-1g ( <i>Ēta</i> 2)

#### 9.9 Overview of All First Declension Paradigms

Notes:

- N-1h contracted nouns are declined exactly like n-1a nouns whose stems end with *alpha-alpha* (-αα). The *alpha* is long in the nominative, accusative, and vocative singular of most n-1a (and all n-1h) feminine nouns; however for those whose antepenult syllable is accented with an acute in the lexical form (*e.g.* ἀλήθεια) the *alpha* is short in these three forms. The dative form is always long because of monophthongization.
- 2. N-1h contracted nouns are declined exactly like n-1b nouns whose stems end with *epsilon-alpha* (-εα).
- 3. The nominal stem *alpha* is short in nouns declined like n-1c. The letter with which the hybrid stem ends cannot be reduced to rule; however  $\alpha/\eta$ -mixed endings always appear after  $z\bar{e}ta$  ( $\zeta$ ), doublelambda ( $\lambda\lambda$ ),  $xs\bar{i}$  ( $\xi$ ), and sigma ( $\sigma$ ). This does not imply that  $\alpha/\eta$ -mixed endings do not appear after other consonants as well!

	§9.9.2 Masculine Nouns				
Uncontracted Nouns	n-1d n-1e		n-1f	n-1g	
Nominative	νεανία <mark>ς</mark>	Σατανα <mark>ς</mark>	μαθητή <mark>ς</mark>	Μανα	ασση <mark>ς</mark>

Accusative	ative		`Ερμῆ <b>ν</b>	- <b>S</b>	ldentical Endings For All Paradigms
Vocative			<b>Έρ</b> μη	-1	Id Fc

Notes:

- 1. All first declension masculine nouns use *sigma* as their nominative case ending. The case ending is borrowed from the second declension since most second declension nouns are masculine and the tendency is to harmonize all masculine nouns.
- All but three nouns in the n-1d paradigm are proper nouns, which of course are declined only in the singular. The only plural forms in NTGreek are two common nouns, μητρολώαις (one who kills his mother) and πατρολώαις (one who kills his father).
- 3. N-1f paradigm nouns differ from n-1d paradigm nouns only in the substitution of *ēta* for *alpha* in the nominative, dative, and accusative singular, and in the use of a short *alpha* rather than a long *alpha* in the vocative singular.
- 4. Contracted masculine n-1h nouns are declined exactly like those in paradigm n-1f. Both feminine and masculine nouns in the n-1h paradigm always have the circumflex over the stem vowel.

## **Study Guide**

First Declension Nouns (Module B) Masculine and Contract Nouns Morphology: The Nominal System (Part 4)

The following exercises will guide the student in grasping the essential elements in this lesson. If you cannot answer a question, take the time now and restudy the material. Remember that there are not any time limits in answering these questions.

#### Exercise One: Fill in the blank.

1. Fill in the blanks with the appropriate form of the article. It is essential to know flawlessly the article paradigm.

	Singular			<b>Plural</b>		
	Masculine	Feminine	Neuter	Masculine	Feminine	Neuter
Nominative						
Genitive						
Dative						
Accusative						

- 2. Supply the article and inflectional endings for the following nouns.
  - a. καρδία, -α<sub>S</sub>, ή (heart)

	n-1a	Singular		Plural	
11-1a		Article	Noun	Article	Noun
	Nominative		καρδία		καρδία
	Genitive		καρδία		καρδι
CASE	Dative		καρδί <u>α</u>		καρδία
0	Accusative		καρδία		καρδία
	Vocative		καρδία		καρδία

# b. $\dot{\alpha}\gamma\dot{\alpha}\pi\eta$ , $-\eta_{S}$ , $\dot{\eta}$ (love)

3. Fill in the blanks with the appropriate paradigm of the designated noun. Except for the genitive plural, the accent will remain over the same vowel throughout the paradigm. In the case of the genitive plural, the circumflex accent will always appear over the *omega*.

**Exercise Two: Mind Bender.** Choose the noun or nouns that are in the same gender, number, and case as the key word. More than one match is possible.

Example: τὴν φωνήν 'Απελλῆν μνᾶς κριτήν

In the example above,  $\phi\omega\nu\eta\nu$  is feminine accusative singular. Although  $A\pi\epsilon\lambda\lambda\eta\nu$  and  $\kappa\rho\iota\tau\eta\nu$  are accusative singular, they would not be chosen because both are masculine nouns.  $M\nu\alpha_S$  would also be incorrect because it is feminine accusative plural.

The difficulty in this exercise arises between reconciling *grammatical* agreement and phonetic dissonance. This is because nouns are being compared across declensions that do not always share the same inflected endings. An example is  $\lambda \delta \gamma \sigma_1$  and  $\pi \rho \sigma \phi \eta \tau \sigma_1$ . The inflected endings,  $-\sigma_1$  and  $-\sigma_1$  are in grammatical concord (masculine nominative plural), although they differ in both spelling and pronunciation.

What is the solution? Know your vocabulary well! This includes the word's gender, nominal stem, declension-paradigm notation, and accent. Strive to learn the nominative and genitive lexical form of every noun. This takes time, patience, and the acknowledgment that learning NTGreek is not easy. The future rewards, however, will be enormous when you can read NTGreek and know the authorial grammatical and syntactical intent of the original Greek authors.

Give the exercise its due time. Begin by parsing the key word. If it is too difficult, then review the inflected endings for that particular paradigm. Both first and second declension nouns are included in this exercise. The article is included with the key word as an aid.

## Exercise Three: Grammatical Parsing. Parse the following forms. .

Lesson 9: First Declension Nouns (Module B) Masculine and Contract Nouns **Exercise Four: True or False.** Circle the correct answer. Be careful, because all of the answer has to be correct in order for it to be true.

- First declension feminine nouns are inflected differently in the plural. True False
- 2. Monophthongization does NOT occur in first declension masculine dative singular nouns. True False
- 3. There are NOT any neuter nouns in the first declension. True False
- 4. There are more masculine nouns in the first declension than feminine nouns. True False
- 5. There are NOT any contract nouns in the first declension. True False
- 6. It is NOT important to memorize the genitive singular for first declension nouns. True False
- 7. The correct declension-paradigm notation for  $M\epsilon\sigma\sigma$  is n-2d. True False
- 8. The correct declension-paradigm notation for  $\mu \alpha \theta \eta \tau \eta_S$  is n-1f. True False
- 9. The correct declension-paradigm notation for  $\beta \alpha \pi \tau_1 \sigma \tau_1 \hat{\gamma}_S$  is n-1f. True False
- The first declension is sometimes called the *alpha*-declension.
   True False
- 11. Monophthongization always occurs in first declension feminine dative singular nouns. True False
- 12. Monophthongization always occurs in first declension masculine dative singular nouns. True False
- 13. There are less paradigms in the first declension than in the second declension. True False
